

Part A - Two Paragraphs: What was your individual contribution to this project? Did you apply and build upon the skills identified in your initial assessment from last Fall? What did you do and how did you do it? What did you learn and what competencies did you build? What were your successes, what were your obstacles?

My main contributions to the project were the frontend implementation and UX design. I also contributed to all the group assignments, but that isn't specific to me, as we all split those pretty evenly. I would say that I did apply the skills we identified in the fall, and there were some instances where I had to learn how to do something new, which was expected, of course. Our frontend was done with React, which I was not entirely familiar with, but it was close to things I had used in the past, so there wasn't much to learn for me there. The front-end has turned out well in my opinion, but it was a little sloppy getting there. There was not much of a plan prior to when we started development, so there were instances where we would make a page on the site that we ended up scrapping or entirely redesigning. Having a more cohesive plan for the exact pages we wanted and what we wanted to put on them would have lessened the load quite a bit.

One of the things that I wanted to do was to test out using coding agents to assist me in the development of the frontend, since I know it is a tool that is not going anywhere anytime soon. I did use the copilot feature a good amount, and it was quite useful. It could not do everything that I asked, and sometime required some careful direction, but overall I was able to learn how to utilize it well, which was one thing I was looking to experiment with over the development of this project. In terms of other accomplishments, I think the overall design of the site and the user-friendliness is quite good and intuitive, which I am proud of.

Part B – Two Paragraphs: What did your group accomplish? What did you learn about group work? What aspects of teamwork were successful and what aspects of teamwork were not successful? How did your efforts on the project compare to that of your teammates? Do any team members deserve special recognition?

Everybody in the group had a fairly defined role that overlapped only a little bit with the others aside from connecting the pieces together. William was the main developer of the backend and the API connections. Michael was responsible for working on the database. Luke was basically the mediator between the backend and frontend, working on getting the API data and database to connect and work with the frontend. We would meet at least once a week and discuss what needs to be done next and any other relevant deadlines. Everybody was communicative and upfront about what they had done, so there were no big issues in that regard.

The biggest issue I would say we encountered as a group is that we were loose with our project deadlines, meaning that there were instances where everybody was busy with other stuff, and it resulted in very little project work getting done that week, and it caused some instances where we had to catch-up a bit to stay on track. In terms of the whole group, though, there were very few instances where we were all stuck with something or had any big issues. I think everyone did roughly the same amount of work for the project, I don't feel like anyone did a crazy amount more than anyone else, which is why I feel we worked together quite smoothly. Everyone had their own specialization, so there wasn't much room for anyone to slack off or step on toes. I would like to recognize William, as it certainly sounded like setting up different APIs was a hassle, especially for the more niche ones (the esports ones). I think the group was very good and we worked together well to make a solid project.
